Ms Silpa				Signature	This project presents an AI-Based Network Intrusion Detection System that identifies malicious and suspicious network activity using Machine Learning techniques. It analyzes network traffic features such as packet counts, connection duration, protocols, ports, and data transfer patterns to classify traffic as normal or malicious. The system evaluates classification models to achieve accurate intrusion detection and provides performance metrics such as accuracy, precision, recall, and F1-score. To improve usability, the system provides alerts and explanations for detected threats, helping users understand the reason behind suspicious activity. A simple dashboard allows users to monitor network traffic, view detected attacks, and assess the overall security status of the network.
